The CIVA ACRO Contest Scoring software

The software has continued to work well throughout 2023, some relatively minor issues resulting from the move to 64-bit status being resolved as soon as they were reported. Most recently it was noted while that “AV”s (average marks) were correctly assessed by the results output system, in the separate judging analysis code there was a discrepancy that required attention; this has now been resolved in the background code, and the next software build will provide the correct output. In the meantime refreshed analysis output will be published and also used by the JC when the 2024 panel selections are made.
