

Spacemodelling is a very important branch of aeronautical sports. It includes the ability to construct perfect space models, promotes the scientific and technological development and the progress of unique designs of models and aircraft that are capable of flying. Space modelling helps us contemplate about the perfect creation of something, not only in sport but life in general. We should think about the way of connecting our knowledge of this beautiful sport with other activities, that would be useful for our environment and our planet. In addition to obtaining knowledge, space modelling enables us to socialise and meet colleagues from other countries and continents around the world.

I am a student at the Faculty of Agriculture in Novi Sad, and I am interested in applying my knowledge of space modelling in agriculture. I live in a rural area where crops are protected by rockets and I would like to put my knowledge into practice.

I believe that this sport deserves to be supported, as well as other sports, and people who are engaged in spacemodelling should be respected in the same way that we respect those who help us.
